

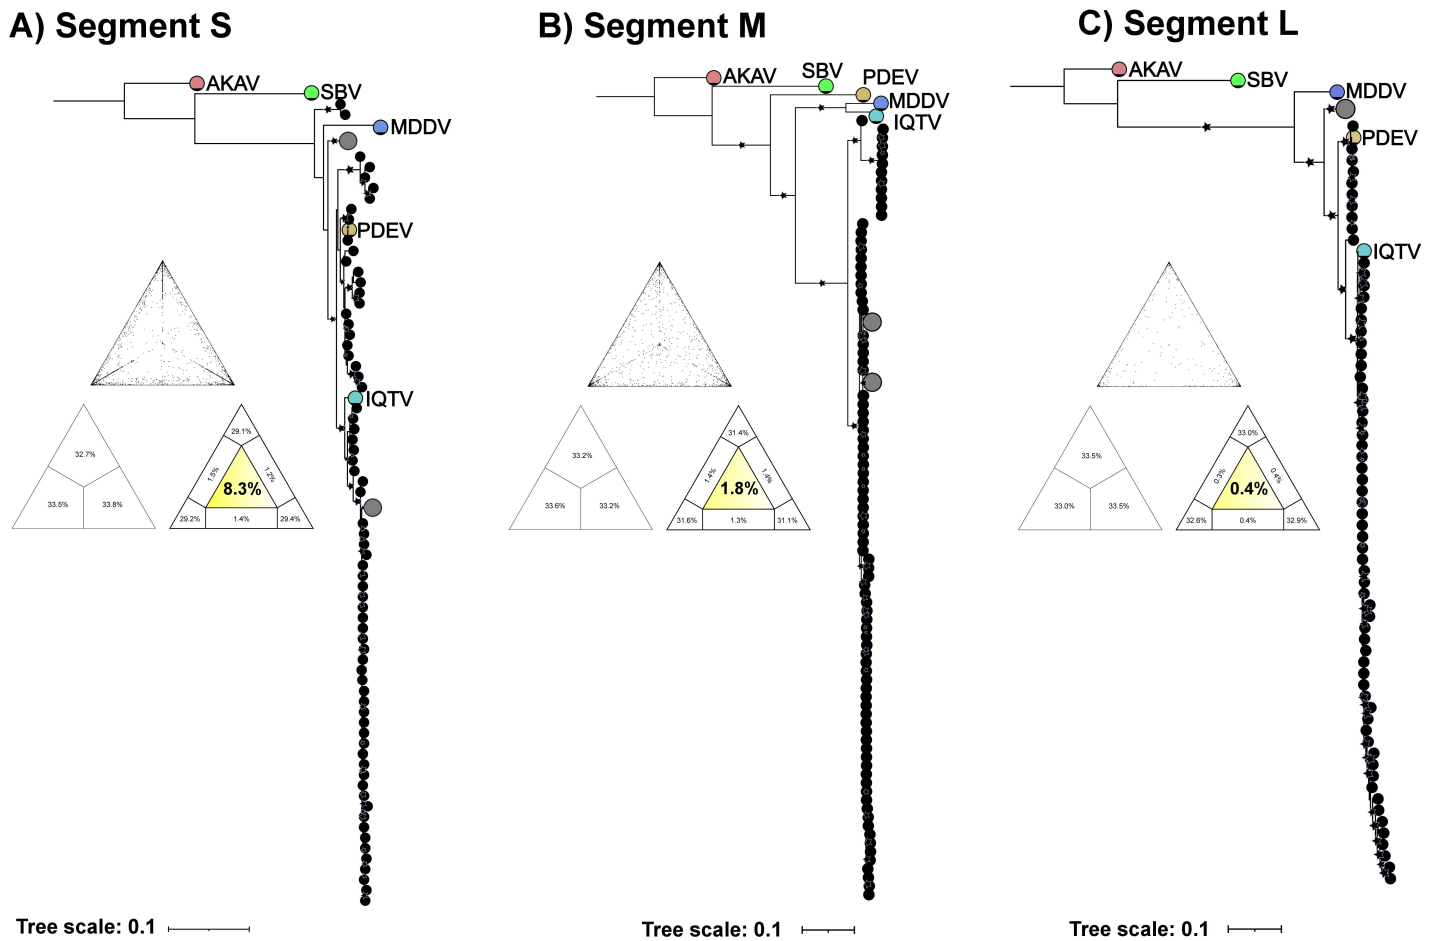

Figure S1. Phylogenetic midpoint-rooted trees and signal of Oropouche virus (OROV) genomic segments. Maximum Likelihood phylogenies of the (A) S, (B) M, and (C) L segments of OROV together with related orthobunyaviruses, each highlighted in different colors. Light gray circles represent collapsed clades of OROV sequences from 2024. Stars on branches indicate Shimodaira-Hasegawa like support values $\geq 80\%$. Likelihood Mapping analyses (triangular diagrams) quantify the phylogenetic signal for each segment, with percentages indicating fully resolved quartets (strong signal) and center percentages indicating phylogenetic noise. If more than 30% of the mapping falls within the center of the triangle, the data are considered unreliable for phylogenetic inference. Abbreviations: AKAV, Akabane virus; IQTV,

Iquitos virus; MDDV, Madre de Dios virus; PDEV, Perdões virus; SBV, Schmallenberg virus.
